FORK GRIPS

ForkGrips are an incredibly useful tool for use with your forklift to help unload flat-bed trucks, containers, utes, vans and trailers. ForkGrips, safely and easily, help you drag loads that are barely within reach of the tips of the forks closer to the edge of the truck so unloading is easy.

Installing ForkGrips

Simply, slipping ForkGrips onto the ends of the forks takes only a matter of seconds.

This is much quicker than using a chain and much safer than climbing onto the truck bed to help push or pull the pallet off of the truck.

Dragging the load closer to the edge
With the ForkGrips on the end of the forks drive the forks under the edge of the pallet or tub and lift the load slightly. With the ForkGrips in position gently drag the load closer to the edge of the truck bed.
