WHEELSPEC Wheel Nut Indicators

WHEELSPEC Australian made **Wheel Nut Indicators** are designed to provide operators and maintenance persons a visual indication of any loose wheel nuts, excessive heating of hubs or braking over use. Proper loose Wheel Nut Indicator Installation and wheel nut torque are important safety requirements.

TOUGH – UV STABILISED – NUMBERED

WHEEL NUT INDICATORS PRODUCT INFORMATION

The **WHEELSPEC Visual Loose Wheel Nut Indicator** is a brightly coloured pointer shaped device that fits tightly over the wheel nut and is positioned in a uniform pattern. It is designed to visually identify any movement of the nut, and/or excessive heating of the hub, due to dragging brakes, or braking over use. If the nut loosens, the **WHEELSPEC Visual Loose Wheel Nut Indicator** will move with it and out of the original uniform pattern, clearly indicating to the operator the need for intervention. In the event of brake drag or over use the **WHEELSPEC Visual Loose Wheel Nut Indicator**, at a temperature of approximately 123 degrees C [248 degrees F], will deform and change colour around the perimeter. Indicating excessive heat build up. If temperature continues to increase, the **WHEELSPEC Visual Loose Wheel Nut Indicator** will sacrifice on the nut – clearly indicating to the repairer the hub or hubs at fault, reducing workshop diagnostic time.

The **WHEELSPEC Visual Loose Wheel Nut Indicator** is manufactured from Heavy Duty Service Grade Polyethylene. UV stabilised polymer provides dimensional stability and stops sunlight degradation.

Remember due to stud stretch and hub/wheel settling, simply retaining nuts from turning will not guarantee a tight wheel.

The **WHEELSPEC Visual Loose Wheel Nut Indicator** can be cleaned using any of available detergent solutions, or kerosene, and are unaffected by road salts or petrochemicals.

The **WHEELSPEC Visual Loose Wheel Nut Indicator** default colour is safety yellow.
