

TESTIMONIALS 2010 – FOR ROTARY HEAT EXCHANGERS PTY LTD

One of our earliest installations goes back 41 years to 1969 when 8 of our 2.5m wheels were installed at the Western Australia Sir Charles Gardiner Hospital, now refurbished and renamed Queen Elizabeth II Medical Centre.

You can't get a higher recommendation for the operation of these wheels than from the hospital engineer John King who now works at the maintenance department of the University of Western Australia. John has recommended the use of our Australian RHE's for the University who have now installed several for campus building energy recycling

The current Deputy Maintenance Manager at QE II Medical Centre Niel Oliver also speaks highly of the eight Mylar heat wheels still performing well after 41 years of continuous operation.

This is not an isolated incident and our RHE's typically outlast the original HVAC equipment they were installed with and even after a refurbishment or overhaul the original RHE's continue to operate satisfactory decades after their installation. We have many high profile examples of this including Melbourne's City Baths, 28 years and Geelong's Belmont Hospital 37 years.
